Title Ocean Health Index calculation package

Author Ben Best, Steve Hastings, Darren Hardy

Maintainer Ben Best bbest@nceas.ucsb.edu>

Depends R (>= 2.14.0),plyr,reshape2,RJSONIO

Description A collection of functions for generically calculating the Ocean Health Index scores as well as individual goals and sub-goals.

CalculatePressures

Calculate the pressures score for each (sub)goal.

Description

Calculate the pressures score for each (sub)goal.

Usage

```
CalculatePressures(layers, conf, gamma, debug = F)
```

Arguments

layers object Layers conf object Conf

gamma (optional) if not specified defaults to 0.5

Value

data.frame containing columns 'region_id' and per subgoal pressures score

CalculatePressuresComponent

Calculate the pressures component of each (sub)goal.

Description

Calculate the pressures component of each (sub)goal.

Usage

```
CalculatePressuresComponent(eco.pressures,
  social.pressures, c.name = "category",
  s.name = "region", gamma = 0.5)
```

Arguments

```
eco.pressures data.frame containing columns 'region', 'category', 'weight', and 'value' social.pressures data.frame containing columns 'region', and 'value' gamma (optional) if not specified defaults to 0.5
```

Value

```
data.frame containing columns 'region', 'p_E', 'p_S', and 'p_x'
```

CalculatePressuresMatrix

Calculate Pressures Matrix

Description

The pressures matrix model function computes a pressures weighting matrix based on regional attributes per category.

Usage

```
CalculatePressuresMatrix(alpha, beta, calc = "avg")
```

Arguments

alpha	the weighting matrix of the form [category x pressure]. Each rank weight must be an integer between 0 and 3 inclusive, or NA.
beta	the aggregation matrix of the form [region_id x category] to collapse across each category.
calc	type of calculation, whether avg (default), mean (diff't from avg?) or presence (results in 1 or 0).

Details

Given:

- g is the goal or subgoal (e.g., AO, CW, LIV, ECO, ...),
- i is the region (e.g., 1, 2, 3, ...),
- *j* is the pressures layer or stressor (e.g., cc_acid, fp_art_lb, etc.).
- k is the category (e.g., habitat, sector, product, etc.)

There may be a component k for a given goal g such that $p_w(g, i, j, k)$ and w(g, i, j, k).

$$p_w(g, i, j, k) = w(g, i, j, k) * p(i, j)$$

In these cases where there is a component k for goal g, there's an additional aggregation or formula to calculate w(g,i,j) based on the core rank weight $\alpha(g,j,k)$ from the original pressures matrix (as written in Halpern et al. (2012)) and some region-specific data for each category k $\beta(i,k)$.

This function CalculatePressuresMatrix will aggregate a category-specific weighting matrix $\alpha(g,j,k)$ [category x pressure] using region-specific data $\beta(g,i,k)$ into a [region_id x pressure] matrix w(g,i,j) used in CalculatePressuresScore, such that:

$$w(g, i, j) = \frac{\sum_{k} \alpha(g, j, k) * \beta(g, i, k)}{\sum_{k} \beta(g, i, k)}$$

1. For the CP, CS goals, the weight depends on the extent A of habitat k in region i:

$$\beta(i,k) = A(i,k)$$

2. For the HAB goal, the weight depends on the presence of habitat k (i.e., if A(i,k) > 0) in region i:

$$\beta(i,k) = hasHabitat(i,k)$$

3. For the LIV and ECO goals, the weight depends on the presence of sector *k* if data available for region *i* and sector *k*:

$$\beta(i,k) = hasSector(i,k)$$

4. For the NP goal, the weight depends on the peak dollar value of each product k across all years (see w_p from SI Equation S27) if data available for region i and product k:

$$\beta(i,k) = w_p(i,k)$$

Value

Returns a weight matrix w [region_id x pressure] suitable for CalculatePressuresScore.

CalculatePressuresScore

CalculatePressuresScore 5

CalculatePressuresScore

Calculate Pressures Score

Description

The pressures score is calculated for each region given a weighting matrix for a goal and the individual pressures values.

Usage

```
CalculatePressuresScore(p, w, GAMMA = 0.5, browse = F,
    pressures_categories = list(environmental = c("po", "hd", "fp", "sp", "cc"), social = "ss"))
```

Arguments

р

the pressures value matrix [region_id x pressure]. Each score must be a real number between 0 and 1 inclusive, or NA. The pressure names must be of the form *category_pressure* where *category* is one of the categories listed in ohi.pressure.category. Use ss to denote the social category.

```
pressure region_id cc_acid cc_sst cc_uv fp_art_hb 1 0.879 0.360 0.764 NA 2 0.579 0.396 0.531 NA 3 0.926 0.235 0.769 NA 4 0.914 0.554 0.795 NA 5 0.860 0.609 0.802 0.001 6 0.871 0.325 0.788 0.001 7 0.846 0.410 0.677 0.000 8 0.806 0.671 0.752 NA 9 0.844 0.595 0.678 NA 10 0.860 0.575 0.781 0.109
```

w

the weighting matrix of the form [region_id x pressure]. Each rank weight must be a real number between 0 and 3 inclusive, or NA.

```
region_id cc_acid cc_sst cc_uv fp_art_hb 1 2 1 0.6 NA 2 2 1 0.5 NA 3 2 1 2.1 NA 4 2 1 3.0 NA 5 2 1 2.8 1 6 2 1 2.2 1 7 2 1 1.3 1 8 2 1 1.7 NA 9 2 1 3.0 NA 10 2 1 1.2 1
```

GAMMA

Multiplier used to combine environmental and social pressures.

Details

Each pressure layer p(i,j) is either environmental or social, belongs to a pressures category $K \in \{cc, fp, hd, po, sp, ss\}$, and has a value (0..1) for each region i and pressures layer j. Each goal has a weight matrix w that has a rank weight between 0 and 3 inclusive, or NoData, for each region i and each pressure layer j on a per goal g basis.

The pressures scores calculations go through 5 steps, using a complex weighting scheme that varies across goals, subgoals, pressures categories, and regions:

- g is the goal or subgoal (e.g., AO, CW, LIV, ECO, ...),
- *i* is the region (e.g., 1, 2, 3, ...),
- *j* is the pressures layer or stressor (e.g., cc_acid, fp_art_lb, etc.).

Calculations

6 CalculatePressuresScore

1. Apply weights for each goal g, region i, and pressure layer j: Each weighted pressure $p_w(g,i,j)$ is the pressure layer value p(i,j) per region i and pressure layer j multiplied by the rank weight w(g,i,j) for that goal g, region i, and pressure layer j. If the w(g,i,j) is NoData or 0, the weighted pressure $p_w(g,i,j)$ is NoData.

$$p_w(g, i, j) = w(g, i, j) * p(i, j)$$

2. Category-level aggregation: The pressures category score p_K is the sum of all p_w within each category, then rescaled to 0..1 using a linear scale range transformation (from 0..3 to 0..1). Any score p_K greater than 1 is capped to 1:

$$p_K(g,i) = \frac{\min(\sum_{j \in K} p_w(g,i,j), 3)}{3}$$

3. Environmental aggregation: The environmental pressures score $p_E(g,i)$ is the weighted sum of $p_K(g,i)$, where each weight is the maximum weight in the pressure category K, and then divided by the sum of the maximum weights:

$$w_{K,max}(g,i) = max(\{\forall_j \in K | w(g,i,j)\})$$

$$p_E(g,i) = \frac{\sum_K w_{K,max}(g,i) p_K(g,i)}{\sum_K w_{K,max}(g,i)}$$

4. Social aggregation: The social pressures score $p_S(g,i)$ is the mean of the *unweighted* social pressure scores p(i,j):

$$p_S(g,i) = \frac{\sum_{j \in S} p(i,j)}{N}$$

5. Gamma combination: The pressures score $p_X(g,i)$:

$$p_X(g,i) = \gamma p_E(g,i) + (1 - \gamma)p_S(g,i)$$

Value

Returns a named vector with the pressures score for each named region.

## End(Not run)
```

CalculateResilience

Calculate the resilience score for each (sub)goal.

Description

Calculate the resilience score for each (sub)goal.

Usage

```
CalculateResilience(layers, conf, debug = FALSE)
```

Arguments

layers object Layers conf object Conf

Value

data.frame containing columns 'region_id' and per subgoal resilience score

CalculateResilienceComponent

Calculate the Resilience component of each (sub)goal.

Description

Calculate the Resilience component of each (sub)goal.

Usage

```
CalculateResilienceComponent(goal.specific.regulations,
  ecological.integrity, social.integrity,
  c.name = "category", s.name = "region", gamma = 0.5)
```

Arguments

```
goal.specific.regulations
(data.frame) contains columns 'region', 'weight', and 'value'
gamma (numeric) represents the weighting between ecological and social aspects of re-
```

Value

(data.frame)

CalculateResilienceScore

Calculate Resilience Score

silience, defaults to 0.5 (equal weights)

Description

The resilience model function computes a resilience score for each region given a weighting matrix for a goal and the individual resilience values.

Usage

```
CalculateResilienceScore(r, t, w = NA, gamma = 0.5,
  resilience_categories = c("environmental", "regulatory", "social"))
```

Arguments

r	the resilience value matrix [region_id x layer]. Each score must be a real number between 0 and 1 inclusive, or NA.
t	the typing vector t[layer] where values are from resilience_categories.
W	the weighting matrix of the form [region_id x layer]. Each rank weight must be a real number >= 0, or NA for even weighting.
w.layers	the weighting vector of the form [layer]. Each rank weight must be a real number >= 0, or NA for even weighting.
gamma	the gamma constant for $r_{i,x}$ calculation.
b	a boolean value matrix [region_id x layer] which is TRUE if the given region_id should include layer, and FALSE otherwise.

10 CalculateResilienceScore

Details

To calculate Resilience for each goal g and region i (r(g,i)) we assess three types of resilience measures j: ecological integrity $(Y_E(g,i))$, goal-specific regulations aimed at addressing ecological pressures (G(g,i)), and social integrity $(Y_S(g,i))$. The first two measures address ecological resilience while the third addresses social resilience. When all three aspects are relevant to a goal, Resilience is calculated for each goal g and each region i:

$$r(g,i) = \gamma * \left(\frac{Y_E(g,i) + G(g,i)}{2}\right) + (1 - \gamma) * Y_S(g,i)$$

where each goal g is comprised of several resilience layers j where w_j is a configuration-time weight to aggregate across resilience categories:

$$G(g, i) = \frac{\sum_{j \in g} w_j G(i, j)}{\sum_{j \in g} w_j}$$

$$Y_E(g, i) = \frac{\sum_{j \in g} Y_E(i, j)}{N}$$

$$Y_S(g, i) = \frac{\sum_{j \in g} Y_S(i, j)}{N}$$

Value

ohi.model.resilience returns resilience score for each region. ohi.model.resilience.matrix returns a weighting matrix suitable for ohi.model.resilience.

Examples

```

CalculateStatusComponent

Compute a single subgoal.

Description

Compute a single subgoal.

Usage

```
CalculateStatusComponent(DATA, fun, trend.Years = 5,
   c.name = "year", s.name = "region")
```

12 CheckLayers

Arguments

DATA data.frame containing columns 'region', 'value', and (optionally) 'w'

fun (optional) function for calculating the subgoal value, if not specified it will de-

fault to a weighted average

w (optional) numeric vector describing the

Value

stuff

CalculateSubgoal

Compute a single subgoal.

Description

Compute a single subgoal.

Usage

```
CalculateSubgoal(current.data, eco.pressures,
  social.pressures, gs.regulations, social.integrity,
  eco.integrity, fun = stats::weighted.mean,
  trend.Years = 5)
```

Arguments

DATA data.frame containing columns 'region', 'value', and (optionally) 'w'

fun (optional) function for calculating the subgoal value, if not specified it will de-

fault to a weighted average

w (optional) numeric vector describing the

Value

stuff

CheckLayers

Check Layers

Description

Check all the input layers as defined by layers.csv and update required fields

Usage

```
CheckLayers(layers.csv, layers.dir, flds_id, verbose = T,
   msg.indent = " ")
```

CheckLayers 13

Arguments

layers.csv	full path to the layers.csv file.
layers.dir	full path to the directory containing the layers files.
flds_id	character vector of unique identifiers, typically spatial, eg c('region_id', 'country_id', 'saup_id'), described in your Conf\$layers_id_fields.
if	True (default), extra diagnostics are output

Details

The CheckLayers() function iterates through all the layers in layers.csv and updates the following field names:

- fld_id_num numeric unique identifier
- fld_id_chr character unique identifier
- fld_category category
- fld_year year
- fld_val_num numeric value
- fld_val_chr character value

Additional diagnostic fields are updated:

- file_exists input filename exists
- val_min minimum value, if numeric
- val_max maximum value, if numeric
- val_0to1 TRUE if value ranges between 0 and 1
- flds_unused unused fields from input file when guessing prescribed field names (aboves)
- flds missing fields expected, as given by Layers units, and not found
- rows_duplicated given the combination of all row-identifying fields (and excluding value fields), the number of rows which are duplicates
- num_ids_unique number of unique ids, as provided by just the unique instances of the fld_id

Value

warning messages

Examples

```
## Not run:
   CheckLayers(layers.csv, layers.dir, c('rgn_id','cntry_key','saup_id'))
## End(Not run)
```

Conf

Conf

Conf reference class.

Description

Conf reference class.

Usage

```
Conf(...)
```

Arguments

dir

path to directory containing necessary files

Details

To create this object, Conf(dir). The dir is expected to have the following files:

- config.R
- \bullet functions.R
- goals.csv
- pressures_matrix.csv
- $\bullet \ \ resilience_matrix.csv$
- resilienceweights.csv

See also Conf_write() to write the configuration back to disk.

Value

object reference class of Config containing:

- config
- functions
- goals
- pressures_matrix
- resilience_matrix
- resilienceweights

Conf_write 15

Conf_write

Write the Conf to disk

Description

Write the Conf to disk

Arguments

dir

path to directory where the Conf files should be output

Details

Use this function to write the configuration to disk, like so conf\$write(dir). This is useful for modifying and then reloading with Conf(dir).

Halpern2012.

Calculate Biodiversity.

Description

Calculate Biodiversity.

Usage

```
Halpern2012.(A, G, w, Cc, Cr, ...)
```

Arguments

placeholder placeholder

Value

1

Halpern2012.AO

Calculate Artisanal Fishing Opportunities.

Description

Calculate Artisanal Fishing Opportunities.

Usage

```
Halpern2012.AO(Sao, Oao, PPPpcGDP, ...)
```

Arguments

placeholder placeholder Sao placeholder placeholder Oao

Value

1

Halpern2012.BD.HAB

Calculate Habitats subgoal of Biodiversity.

Description

Calculate Habitats subgoal of Biodiversity.

Usage

```
Halpern2012.BD.HAB(Cc, Cr, ...)
```

Arguments

placeholder placeholder

Value

1

Halpern2012.BD.SPP

Calculate Species subgoal of Biodiversity.

Description

Calculate Species subgoal of Biodiversity.

Usage

```
Halpern2012.BD.SPP(A, G, w, ...)
```

Arguments

placeholder placeholder

Value

Halpern2012.CP

Halpern2012.CP Calculate Coastal Protection

Description

Calculate Coastal Protection

Usage

```
Halpern2012.CP(Cc, Cr, w, A, ...)
```

Arguments

placeholder placeholder Cc current 'condition' of habitat k
placeholder placeholder Cr reference 'condition' of habitat k
placeholder placeholder A amount of area covered by habitat k
placeholder placeholder w rank weight of habitat protective ability

Value

1

Halpern2012.CS Calculate Carbon Storage

Description

Calculate Carbon Storage

Usage

```
Halpern2012.CS(Cc, Cr, A, ...)
```

Arguments

placeholder placeholder Cc current 'condition' of habitat k
placeholder placeholder Cr reference 'condition' of habitat k
placeholder placeholder A amount of area covered by habitat k

Value

18 Halpern2012.FP

Halpern2012.CW

Calculate Clean Waters.

Description

Calculate Clean Waters.

Usage

```
Halpern2012.CW(a, u, 1, d, ...)
```

Arguments

placeholder placeholder a number of coastal people without access to sanitation rescaled to

global maximum

placeholder u 1 - (nutrient input)
placeholder placeholder l 1 - (chemical input)
placeholder placeholder d 1 - (marine debris input)

Value

1

Halpern2012.FP

Calculate Food Provision.

Description

Calculate Food Provision.

Usage

```
Halpern2012.FP(w, dBt, mMSY, Bt, Tc, k, Smk, Ac, Yk, ...)
```

Arguments

placeholder placeholder k each mariculture species

placeholder yl yield of each species k

Value

Halpern2012.FP.FIS

Halpern2012.FP.FIS

Calculate Fisheries subgoal of Food Provision.

Description

Calculate Fisheries subgoal of Food Provision.

Usage

```
Halpern2012.FP.FIS(mMSY, Bt, Tc, ...)
```

Arguments

placeholder placeholder dBt absolute difference between landed biomass and mMSY

placeholder mMSY multi-species maximum sustainable yield placeholder placeholder Tc taxonomic report quiality correction factor

placeholder Bt wild-caught fishing yield

Value

1

Halpern2012.FP.MAR

Calculate Mariculture subgoal of Food Provision.

Description

Calculate Mariculture subgoal of Food Provision.

Usage

```
Halpern2012.FP.MAR(k, Smk, Ac, Yk, ...)
```

Arguments

placeholder placeholder k each mariculture species

placeholder Smk sustainability score for each species k
placeholder placeholder Ac area of coastal waters (3nm strip)

placeholder Yl yield of each species k

Value

20 Halpern2012.LE

Halpern2012.ICO	Calculate Iconic Specie	s subgoal of Sense of Place.
11d1pe11120121100	Caremare reonic specie	s sue gour of serise of 1 race.

Description

Calculate Iconic Species subgoal of Sense of Place.

Usage

```
Halpern2012.ICO(S, w, ...)
```

Arguments

placeholder S number of assessed species in each category placeholder placeholder w status weight assigned per threat category

Value

1

Halpern2012.LE (Calculate C	Coastal Livelihoo	ds and Economies.
------------------	-------------	-------------------	-------------------

Description

Calculate Coastal Livelihoods and Economies.

Usage

```
Halpern2012.LE(jc, jr, gc, gr, ec, er, ...)
```

Arguments

placeholder	placeholder jc total adjusted jobs per sector at current time
placeholder	placeholder jr total adjusted jobs per sector at reference time
placeholder	placeholder gc average PPP-adjusted per-capita annual wages per sector in current region
placeholder	placeholder gr average PPP-adjusted per-capita annual wages per sector in reference region
placeholder	placeholder ec total adjusted revenue generated per sector at current time
placeholder	placeholder er total adjusted revenue generated per sector at reference time

Value

Halpern2012.LE.ECO 21

Halpern2012.LE.ECO

Calculate Economies subgoal of Coastal Livelihoods and Economies.

Description

Calculate Economies subgoal of Coastal Livelihoods and Economies.

Usage

```
Halpern2012.LE.ECO(ec, er, ...)
```

Arguments

placeholder placeholder ec total adjusted revenue generated per sector at current time placeholder placeholder er total adjusted revenue generated per sector at reference time

Value

1

Halpern2012.LE.LIV

Calculate Livelihoods subgoal of Coastal Livelihoods and Economies.

Description

Calculate Livelihoods subgoal of Coastal Livelihoods and Economies.

Usage

```
Halpern2012.LE.LIV(jc, jr, gc, gr, ...)
```

Arguments

placeholder	placeholder jc total adjusted jobs per sector at current time
placeholder	placeholder jr total adjusted jobs per sector at reference time
placeholder	placeholder gc average PPP-adjusted per-capita annual wages per sector in current region
placeholder	placeholder gr average PPP-adjusted per-capita annual wages per sector in reference region

Value

22 Halpern2012.NP

Halpern2012.LSP	Calculate Lasting Special Place	es subgoal of Sense of Place.
	Concontract Edistrict Special Trace	

Description

Calculate Lasting Special Places subgoal of Sense of Place.

Usage

```
Halpern2012.LSP(CMPA, tCMPA, CP, tCP, ...)
```

Arguments

```
placeholder placeholder CMPA coastal marine protected area placeholder placeholder tCMPA total coastal marine area placeholder placeholder CP coastline protected placeholder tCP total coastline
```

Value

1

Halpern2012.NP	Calculate Natural Produc	cts. (Needs work)
Haiper Hzo iz.iii	Calculate Hattifat I Touti	sis. (Itecus work)

Description

Calculate Natural Products. (Needs work)

Usage

```
Halpern2012.NP(N, wp, Hp, E, R, Nv, Nk, w, ...)
```

Arguments

placeholder	placeholder N number of products that have ever been harvested
placeholder	placeholder wp proportional peak dollar value of each product relative to the total peak dollar value of all products
placeholder	placeholder Hp harvest of a product relative to its buffered peak reference point
placeholder	placeholder E exposure term
placeholder	placeholder R risk term
placeholder	placeholder Nv 1 or 2, depending on whether or not a viability term is used
placeholder	placeholder Nk number of species in each k category of exploitation
placeholder	placeholder w weight assigned to each k category of exploitation status

Value

Halpern2012.SP 23

Halpern2012.SP Calculate Sense of Place.

Description

Calculate Sense of Place.

Usage

```
Halpern2012.SP(S, w, CMPA, tCMPA, CP, tCP, ...)
```

Arguments

```
placeholder placeholder S number of assessed species in each category
placeholder placeholder w status weight assigned per threat category
placeholder placeholder CMPA coastal marine protected area
placeholder placeholder tCMPA total coastal marine area
placeholder placeholder CP coastline protected
placeholder placeholder tCP total coastline
```

Value

1

Halpern2012.TR Calculation

Calculate Tourism and Recreation.

Description

Calculate Tourism and Recreation.

Usage

```
Halpern2012.TR(D, t, V, S, ...)
```

Arguments

```
placeholder D number of tourist-days
placeholder placeholder t most recent year
placeholder placeholder V total region population size
placeholder placeholder S sustainability factor
```

Value

24 Layers

Layers

Layers reference class.

Description

Layers reference class.

Usage

```
Layers(...)
```

Arguments

layers.csv path to comma-seperated value file with row of metadata per layer

layers.dir path of directory containing individual layer files

Details

To instantiate this object, Layers(layers.csv, layers.dir) is used. The layers.csv is expected to have the following columns:

- *layer* unique identifier (no spaces or special characters)
- targets the pipe and space (' | ') delimited list of targets (goal name, 'Pressures' or 'Resilience') to feed this data layer
- title full title of the variable
- description detailed description
- citation reference for documentation
- units indicating units and required column name in the layer csv file
- filename the csv data file for the layer

The layers.dir directory should contain all the csv filenames listed in the layers.csv file.

Value

object (non-instantiated) reference class of Layers containing

- meta metadata data frame of original layers.csv
- data named list of data frames, one per layer
- *targets* named list of character vector indicating a layer's targets, goal (status, trend) or dimension (pressures, resilience)

layers.Global2012.Nature2012ftp

Layers accompanying Nature 2012 publication on the FTP site for Global 2012 analysis.

Description

These layers get used to calculate the Ocean Health Index.

Format

a Layers object

References

```
http://ohi-science.org
```

layers.Global2012.www2013

Layers used for the 2013 web launch applied to Global 2012 analysis.

Description

These layers get used to calculate the Ocean Health Index.

Format

a Layers object

References

```
http://ohi-science.org

layers.Global2013.www2013

Layers used for the 2013 web launch applied to Global 2013 analysis.

Description

These layers get used to calculate the Ocean Health Index.

Format

a Layers object

References

```
http://ohi-science.org
```

Scores

Scores reference class.

Description

Scores reference class.

Usage

```
Scores(...)
```

Arguments

scores.csv

path to comma-seperated results file, long style

Details

To instantiate this object, Scores(results.csv) is used. The results.csv is expected to have the following columns:

- region_id unique numeric region identifier, reserving 0 as the region_id for the area-weighted average of the entire study area
- goal the goal code or Index
- dimension the dimension code, one of: status, trend, pressures, resilience, future, score
- score the numeric score: 0-100 for all dimensions, except trend (-1 to 1)

To get the wide view (many columns, with one row per region and columns having combination of goal and dimension), use something like: reshape2::dcast(.self\$long, region_id ~ goal + dimension, value.var='score').

Value

object reference class of Layers containing

• data - long view (many rows) of score results with columns: region_id, goal, dimension, score

scores.Global2012.www2013

Scores resulting from the 2013 web launch applied to Global 2012 analysis.

Description

These scores are the results of the Ocean Health Index.

Format

a Scores object

References

http://ohi-science.org

```
scores.Global2013.www2013

ScoreScaling

Score Scaling Functions

Description

Scoring functions

Usage

```
score.rescale(x, xlim = NULL, method = "linear", ...)
```

Arguments

x A numeric vector of data.
 xlim The scoring range. If null, derives range from data.
 p A percentage buffer to add to the maximum value.

method Only 'linear' is supported.

... Arguments for min, max, pmin, pmax.

Value

Returns scores.

See Also

```
min, max, pmin, pmax
```

Examples

```
score.max(c(0.5, 1, 2))
score.max(c(0.5, 1, 2), p=0.25)
score.rescale(c(0.5, 1, 2))
score.clamp(c(-0.5, 1, 2))
score.clamp(c(-0.5, 1, 2), xlim=c(-1, 1))
```

28 SelectLayersData

SelectLayersData

Select Layers to Data

Description

Select Layers to Data

Usage

```
SelectLayersData(object, targets = NULL, layers = NULL,
  cast = TRUE, narrow = FALSE,
  expand.time.invariant = FALSE)
```

Arguments

object instance of Layers class

targets specifies the targets of layers to be selected, defaulting to c('regions')

layers specifies the layers to be selected. If given as a named character vector, then

layers get renamed with new names as values, and old names as names per

plyr::rename

narrow narrow the resulting data frame to just the fields containing data (as described

by flds in the default wide result) #

expand.time.invariant

for layers without a year column, populate the same value throughout all years

where available in other layer(s) #

cast whether to cast the resulting dataset, or leave it melted, defaults to TRUE

Details

If neither targets or layers are specified then all layers are returned. If targets and layers are specified, then the union of the two sets of layers are returned, with any renamed layers renamed.

Value

data.frame with the merged data of selected layers having the following fields:

- layer layer name, possibly renamed
- layer0 original layer name, if fed a named character vector to layers
- id_num numeric id
- id_chr character id
- id_name fieldname of id
- category category
- category name fieldname of character
- year year
- val_num numeric value
- val_chr character value
- val_name fieldname of value, usually in units as specified in Layers
- flds data fields used for the layer

SpatialSchemes 29

SpatialSchemes	SpatialSchemes reference class.

Description

SpatialSchemes reference class.

Usage

```
SpatialSchemes(...)
```

Value

object (non-instantiated) reference class of SpatialSchemes

TransformSpatialScheme

Transform data

Description

Transform data

Usage

```
TransformSpatialScheme(object, data, target, origin,
  categories)
```

Arguments

 $object \hspace{1cm} instance \ of \ Spatial Schemes \ class$

data data.frame such as returned from 'SelectLayersData' function target single spatial scheme to which data should be transformed origin spatial schemes from which to transform, can be vector

categories layers for which transformation should be done (to be safe, for now this should

be all the layers in param data)

Value

data.frame transformed data
